

ADVANCE YOUR CAREER WITH A PH.D. IN CLINICAL PSYCHOLOGY

UT Tyler's Ph.D. in clinical psychology is a scientist-practitioner based program providing high quality academic, research and clinical experiences with a unique focus on mental health for underserved populations.

- The program offers general clinical training with emphasis tracks in rural mental health, veteran's issues, and older adults – areas that are in high demand nationwide.
- Students receive a generous financial support package to allow them to focus primarily on their studies. Research and teaching assistantships are available to students.
- Graduates are prepared to become licensed psychologists serving in a variety of academic, medical, and clinical settings.

Rural Track

Prepare to practice among populations with the greatest needs for mental health services. Rural communities have higher suicide rates, greater incidence of behaviorally-influenced medical problems and multiple barriers to accessing mental health services. Learn effective evidence-based practices for working with rural populations, engage in research that advances knowledge, and practice with this population.

Veteran's Track

Receive additional training and coursework to serve military veterans and service members who are at an increased risk for experiencing a wide range of psychological distress. You will learn to understand military culture and treat their needs, while also adding to the knowledge and intervention base through research.

Geropsychology Track

Specialize in an area of practice that is in high demand as the population of older adults continues to increase. Receive training and coursework to provide clinical services and conduct research relevant to older adults. Neuropsychological assessment with aging populations is a major emphasis of this track.
