

CENG 3434

For my contract course, I will be working with Dr. Michael Gangone in my Material Codes and Specifications class. My contract work will be designing and constructing different concrete posts. After letting these posts cure, I will be testing them for their stress and strain properties with a Tinneas machine. Once this data has been recorded and specific calculations have been made, I will be presenting my findings to my class. Since the class will not be able to do this in lab experimentation, this presentation will be a supplement to their studies, as well.
